BOTHE LIQUID CRYSTAL DEVICE AND ELECTRONIC EQUAL

In a figuric crystal device formed so that an electric field (113) ashatemially parallel to a bound surface or potential of a conductive film formed on a color film-familing bound (104) opposed to an electric field control measure of earth potential, common relectrade potential, counted potential of an image signal, non-selective potential of potential of an external driving means and floating condition. This combins a liquid crystal device capable of displaying a high-quality image into which make electricity is difficult to exter to be provided.
